Because most lakes and oceans contain suspended living matter and mineral particles, known as colored dissolved organic matter CDOM, light from above is reflected upwards. Testing for color can be a quick and easy test which often reflects the amount of organic material in the water, although certain inorganic components like Colors of the Sea or manganese can also impart color.

There are other substances that may be found dissolved in the water that can also impart color. As beautiful as they are, these images have a greater purpose. Testing for color can be a quick Colors of the Sea easy test which often reflects the amount of organic material in the water, although certain inorganic components like iron or manganese can also impart color. If there are any particles suspended in the water, they will increase the scattering of light.

Then, by comparing these phytoplankton trends to other measurements - such as satellite data - the ocean over regions with high concentrations of phytoplankton will appear as certain shades, from blue-green to green, depending upon the type and density of the phytoplankton population. A hint of turquoise in the muffled-glass panes gives the French doors a subtle glow by lamplight.
